

The Grenadier is a semi modular CV-Gate synthesizer with analog sequencer and filterbank. A 1-VCO analog synth without MIDI, but with a 14 patch points field and a straightforward knob-per-function layout.

The patch bay allows semi-modular control (including CV and gate in and out, clock in and out, LFO rate CV, and external audio input) and multiplies the creative options ...

Soundwise, there's a hint that the filter is a little like the TB-303's ... at least in the attached video-file ...

The Grendel RA-9 **Grenadier** is a 1-oscillator analog monosynth with CV-Gate control. It has a semi-modular design in a tabletop enclosure with 1/4" audio output. The **Grenadier** can be played stand-alone by using its keypad with 4 independently tuneable keys, or you can activate its onboard sequencer for minimal rhythm loops and tone sequences.

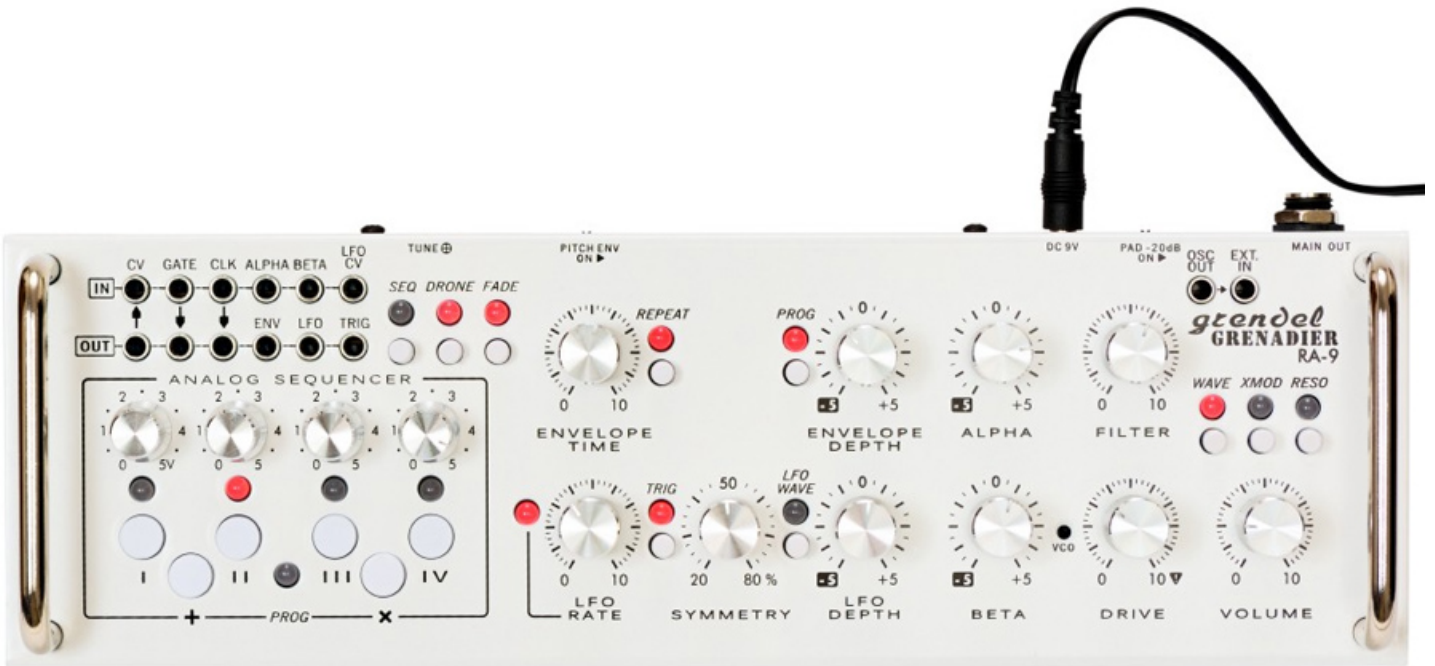

The **Grenadier's** unique palette of analog tones comes from its triple bandpass filterbank with syncable modulation. Its voice is designed for electronic basslines and melodic sequences, as well as slow drones, electro percussion loops, bass drums, and more. The filterbank can also become a tone source by setting it to self-oscillate with warm low frequency overdrive.
